AssetTrust v0.56

Vite entrypoint repair and compiled browser artifact security gate

RELEASE DECISION: NO-GO — do not host customer asset evidence or accept commercial transactions on this checkpoint.

Confirmed defect resolved

The React/Vite workspace lacked **apps/web/index.html**, required for a Vite build. v0.56 adds the module entry **/src/main.tsx**, a React **#root** mount, and standard metadata. A real build remains unverified.

New post-build controls

The **build-artifact-gate-v56.cjs** now checks the frontend entry, local imports and public browser environment access before installation; after compilation it checks compiled API/web outputs, linked assets, forbidden deployment files, symlinks, and sensitive server-side markers in browser bundles.

These checks are **heuristic**; they cannot prove a compiled app is free of every secret or browser vulnerability.

Executed test evidence

Verification	Result	Scope
v0.56 security tests	20 / 20 PASS	Positive and adversarial test fixtures
Version suite commands	54 / 54 PASS	v0.03 through v0.56; offline only
CI / source / architecture	PASS	YAML policy and 104 TS/TSX syntax files
Web source imports	PASS	101 source files; 283 relative imports
SQL migration integrity	25 / 25 MATCH	No new SQL migration or database execution
Source secret scan	0 findings	2,393 source files; pattern-limited
Full API + web build	BLOCKED	Missing npm lockfile and dependencies
Post-build artifact gate	BLOCKED	No compiled API/web outputs in this environment
Live security tests	NOT RUN	PostgreSQL, ClamAV, browser, TLS, Git history

Build and release limitations

No genuine reviewed lockfile or installed dependencies exist here. The build reports missing Node/NestJS types; the post-build gate correctly refuses absent outputs. Readiness: **3/11 prerequisites present**.

Still unverified: live PostgreSQL/RLS, original Git history, ClamAV, two-server/browser tests, HTTPS/SSH and backup restoration.

Required next steps on Kali

On trusted Kali, create/review the authentic lockfile; run npm ci, audit, tests and build; then run **npm run build:artifacts:v56** and supervised live checks against a disposable database. Record sanitized evidence before independent release approval.
